## QUADRO 4D UNDERMOUNT SLIDES - IW21

### Additional Information

Quadro is the only ball bearing European undermount slide on the market.

Quadro has a unique I-bar construction.

Quadro's chrome steel ball bearings are encased in plastic to provide an unmatched feel and movement.

Quadro's compact size leaves the smallest footprint.

Quadro is the original undermount slide.

Quadro has height, side depth and rear tilt adjustments. All positions can be adjusted easily. The rear tilt can be adjusted with finger or tool.

One slide fits all: Overlay and inset drawers have equally easy installation. The depth adjustment is on the slide, and the front clip includes side adjustment. The spring loaded rear hook allows for use of a rear tilt adjustment or a drilled rear hole. The 100 lb. capacity can handle all but the largest drawers.

The drawer connects easily to the slide, with the installed slide in any position. You do not have to extend the slide or guide it into the front clip.

The drawer disconnects easily. Because of the rear hook spring, the slide disconnects as soon as the front clip is released.

Unlike all existing undermounts, the 4D Quadro connects securely even when adjusted to its most extreme positions. This is true even when adjustments counter each other. Conversely, you can disconnect the slide in any adjusted position. With the Quadro, you will never get a call back from a customer who cannot remove or reinstall a drawer. This cannot be said of any other undermount slide.

The rear hook spring allows for drawers up to 1/2" longer than the slide length.

The front clips can be installed with screws straight into the drawer bottom or angled into the front.
